Due to special market circumstances, the synthetic portion of the Corporate AA curve based on the Spread Ratio proved to be inconsistent with actual bond yields observed in the market on November 30, 2020, such as the Corporate A-rated bond yields. As such, adjustments were required for the November 30, 2020, CIA Accounting Discount Curve.

The spot rates for maturities up to 10.5 years have been determined in accordance with the usual methodology, as per the CIA's Educational Note. Exceptionally for November 30, 2020, for maturities greater than 10.5 years, the spot rates were adjusted to make them converge to the 30-year spot rate of an A-rated corporate bonds curve. The universe of bonds used to construct the A-rated corporate bonds curve excludes quasi-governmental entities and is based on the average-rating methodology (as opposed to the best-rating methodology, which is used to select the AA-rated corporate bonds universe for the CIA Accounting Discount Curve). The resulting A-rated corporate bond universe consist of 335 bonds with minimum issue size over \$100M.

The CIA Accounting Discount Curve was then adjusted from the 10.5-year spot rate (determined in accordance with the usual methodology) to the 30-year spot rate of this A-rated corporate bonds curve using the same parametric equation that is typically used (Nelson-Siegel-Svensson). Note that the 30-year spot rate under this special methodology is 0.16% lower than the usual methodology. Note that for information purposes, the Spread Ratio in the table above is presented using the usual methodology and does not reflect the adjustments that were exceptionally applied in the long term.

Effective May 29, 2020, the provincial bond subset used to construct the CIA Accounting Discount Curve excludes two 'ultra-long' bonds that mature in roughly 100 years as the pricing of these bonds was deemed unreliable (given the apparent lack of liquidity).
